

Figure S2. Alpha diversity of kākāpō on different supplementary diets, of different ages, or on different islands

Left: Chao1 species richness estimate. Right: Simpson's evenness. **(A)** Adult kākāpō on three different diets. HPC = Harrison's High Potency Coarse pellets. Pumpkin = pumpkin-based pellets. Unfed = no history of supplementary feeding in the 2016 breeding season prior to sampling. **(B)** Chicks versus adult kākāpō on Codfish Island during the 2016 breeding season. **(C)** Adults that were relocated from Maud Island or Pearl Island to Codfish Island. **(D)** Chicks that were hatched and raised on Anchor Island or Codfish Island.
